5th May, 2022 1 / 22

Outline

- 2 GRAPES-3 Experiment
- 3 Data Handling
- 4 Solar Diurnal Anisotropy Analysis

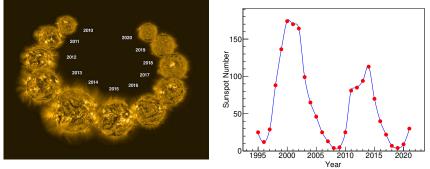

-

► < Ξ ►</p>

Motivation

- The Sun's magnetic field undergoes a 11 year cycle.
- The modulation effects of cosmic rays have been extensively investigated to understand the solar terrestrial environment.

Evolution of Sun in extreme UV light by PROBA2 spacecraft (ref:https://spaceplace.nasa.gov/solar-cycles/en/)

GRAPES-3 Experiment

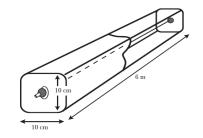

- Located at Ooty, India (11.4° N, 76.7° E and 2.2 km above msl).
- 400 plastic scintillation detectors (1 m² each) spread over 25,000 m².
- Tracking muon telescope (560 m²).

Meeran Zuberi (TIFR)

Tracking Muon Telescope

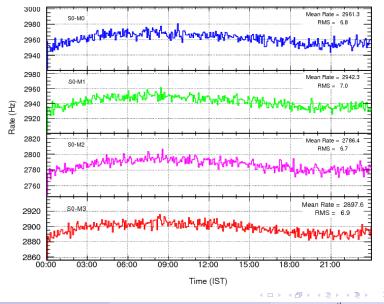

- Proportional counter (PRC) is the basic element
- Total = 3712 PRCs
- 4 super-modules (140 m² each) = 560 m².
- 2.4 m thick concrete absorber, $E_{\mu} = Sec(\theta) \text{ GeV}$
- Sky coverage = 2.3 sr

Muon Telescope Module Data

Meeran Zuberi (TIFR)

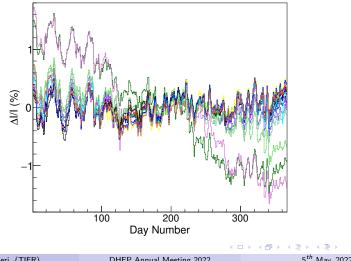

DHEP Annual Meeting 2022

5th May, 2022 6 / 22

- GRAPES-3 muon telescope is continuously recording data from past two decades.
- Sudden power failure or the instrument problems can cause the abnormality in the data.
 - Single bin drop
 - Single day module rate
 - Long-term module rate
- Such data periods need to be identified and corrected (if possible) before using it for any physics analysis.

Long-term Module problem Handling (2008)

The normalized module rates are averaged over one day.

5th May, 2022 8 / 22

Final Muon Rate (2001-2021)

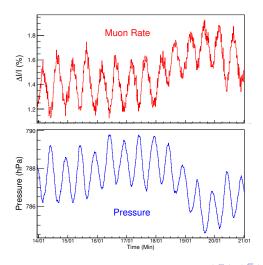

Final Muon Rate (2001-2021)

T. Nonaka et al., Physical Review D 74, (2006) 052003

Atmospheric Pressure Effect

Muon rate shows the anti-correlation with atmospheric pressure.

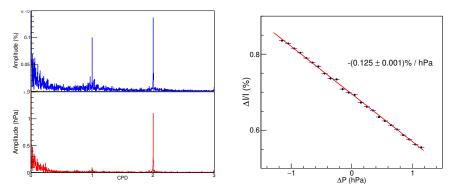

Meeran Zuberi (TIFR)

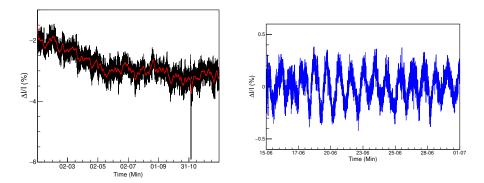

5th May, 2022 10 / 22

Atmospheric Pressure Coefficient (Year-2020)

A fast Fourier transform technique is used to obatin the pressure coefficients.

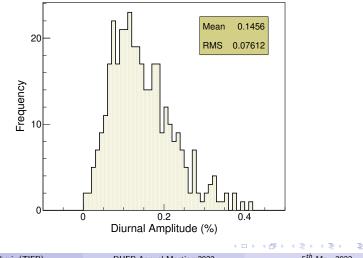

A three-day running average is used to filter out the slow variations.

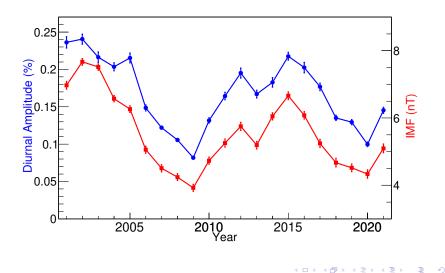

Yearly DA Distribution (Year-2021)

Fourier series technique is used to obtained the daily diurnal amplitudes.

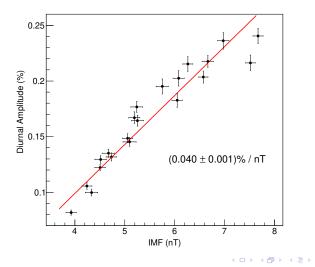

Yearly variation of DA Amplitude and IMF

5th May, 2022 14 / 22

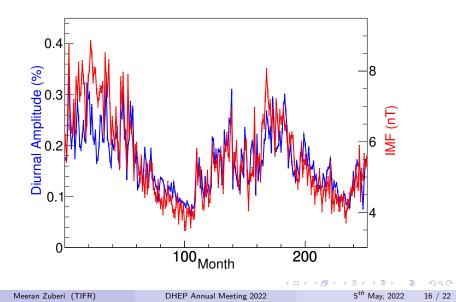

Yearly Relationship between DA Amplitude and IMF

Correlation Coefficient = 0.95 ± 0.07

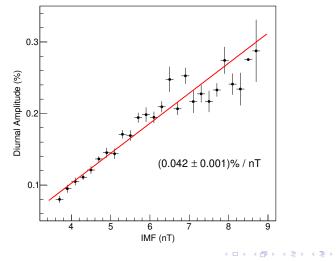

5th May, 2022 15 / 22

Monthly variation of DA Amplitude and IMF

Monthly Relationship between DA Amplitude and IMF

Correlation Coefficient = 0.85 ± 0.03

DHEP Annual Meeting 2022

5th May, 2022 20 / 22

- A continuous data stream of G3MT for 21 years (2001-2021) is prepared after taking care of the intermittent and long-term problems.
- The pressure corrections are applied using the pressure coefficient obtained from the min solar activity period (2020) data.
- A strong correlation is observed between solar diurnal anisotropy (SDA) and the interplanetary magnetic field (IMF) on yearly and monthly time scales; hence it can be used as a good proxy for the IMF.
- The phase of the SDA shows a prominent 22 Y periodicity corresponding to the time shift towards the earlier hours for minimum solar activity periods.

Single Day Module Problem Handling

- The lowest RMS module (RMS > 0) is considered as a most stable module of the day.
- After identification of the stable module, the ratios of other modules with stable module are calculated

 $Ratio_{K-Module} = \frac{K-ModuleMean}{StableModuleMean}$

• Now these ratios are used to fill the missing data of all other modules by using the stable module data.

Data Gaps Handling

Atmospheric Pressure Correction (2001-2021)

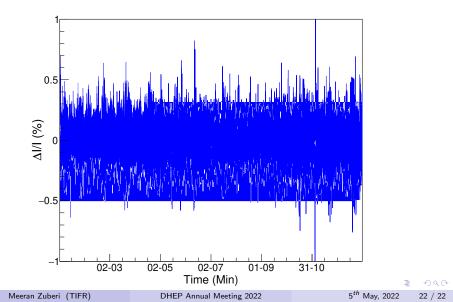

Solar Diurnal Anisotropy

- The modulation effects of cosmic rays have been extensively investigated to understand the solar terrestrial environment.
- Ground based detectors record the diurnal variations every day as their acceptance cone sweeps through the direction containing the spatial anisotropy.
- The solar diurnal anisotropy (SDA) variation of cosmic ray intensity shows significant day-to-day variation reflecting the continuously changing conditions in the interstellar space.
- The quantitative study of SDA amplitude and phase can better understand daily solar modulations and their relationship with other solar parameters.
